CHE 410	Spectrometric Identification of Compounds

Research Interest

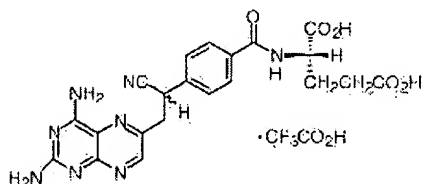

Folic acid (1) is a vitamin which in its reduced form is involved in several cellular one-carbon transfer reactions, among them the conversion of 2'-deoxyuridine-5'-monophosphate (dUMP) into 2'-deoxythymidine-5'-monophosphate (dTMP). Methotrexate (2), first introduced clinically in 1953 and still widely used in cancer chemotherapy, acts by inhibiting dihydrofolate reductase, the enzyme required for the reduction of folic acid. My students and I are working on the synthesis of a number of analogues of Methotrexate. Compound 3, an N-10 deaza analogue of Methotrexate, has recently been prepared in our laboratories.

Folic Acid (1)

Methotrexate (2)
